

EINDHOVEN AI

PROJECT PROPOSAL

Version
1

Authored by
**CHRIS, TIM, JULIAN,
YANNICK, YVONNE,
OLIVIA, FELIX**

OKTOBER
2025

ABOUT THE PROJECT

An AI that can have a conversation with people based on information related to their immediate surroundings, history and properties.

Most likely the AI will be functioning as an object with personality. The idea is that people can have a conversation with the object. The object can tell things about what it has been taught.

There are many examples of objects in Eindhoven that could be turned into a personality, for example: Building, lanterns, benches, statues, roads and roadsings. The project might be most likely to happen in certain areas in the city that are widely spread. These could be parks. There are many parks in Eindhoven and they almost all have statues, benches, but also trees, bushes, and flowers.

Any of these objects could have their own story to tell, with their own “voice”.

Perhaps they have something to tell about their early years, or perhaps they just want to rant about the weather.

Any object can become a meaningful storyteller to those who wish to seek it out.

PURPOSE

The purpose of the proposed project is to create a mix of fun interactive objects and the city of Eindhoven.

By giving everyday objects a personality, people can engage with their surroundings in new, playful, informative, and meaningful ways.

- **Informing and teaching residents about the city**
- **Helping people that are lonely and feeling alone.**
- **Bring the city of Eindhoven to life in a whole new way.**

This project aims to blend the urban culture of Eindhoven with technology and creativity. By turning everyday objects into interactive personalities, we not only enhance public spaces, but also foster connection and curiosity.

TARGET AUDIENCE

As parks, benches, and statues get a wide array of visitors, the target audience is not bound to one group of people. The common denominator is that most are either local residents or tourists & visitors.

The target audience can be split into two main groups:

1. Frequent Visitors

- Local residents: People who regularly use the parks & public spaces
- Adults & families: learning more about their city during leisure time
- Elderly citizens: finding companionship and information during park visits
- Students & young adults: exploring playful, tech-driven experiences in their city

2. One-off visitors

- Tourists & visitors: exploring Eindhoven for short periods of time
- Families with children: experiencing playful and story-driven conversations that make their outings more engaging and memorable.

The project's purpose is to bring Eindhoven's parks and landmarks to life by giving everyday objects a voice that can inform, entertain, and connect people in meaningful ways. By focusing on both frequent visitors as well as one-off visitors, the interactive objects create value for a broad and diverse audience.

PROJECT GOAL

To develop an AI-driven object personality that can communicate with people about its own characteristics, experiences, and surroundings using historical, real-time, and contextual data. By giving objects such as benches, statues, trees, or bushes a voice and a personality, we want to bring the city to life and create a new type of interaction between people and their environment.

Besides offering information we want to explore how these interactive objects can generate social value. For example, they can help to reduce feelings of loneliness by offering a friendly conversation or supporting tourists by sharing their stories and learning facts about the city. Ultimately the goal is to demonstrate how AI can be used to strengthen the relationship between humans, residents, visitors and their city, and how technology can play a role in creating a more connected environment.

"We want to bring the city to life and create a new type of interaction between people and their environment."

WHO WE ARE

Julian Manders

Marketing

Working as a technical marketing expert at MOEVS. Also I have my own company called Brighttown that makes websites, runs social media accounts and do graphic designs for mostly restaurants.

Tim Lemmens

Group-lead & Developer

As a (front-end) developer I like diving into new challenges with new ideas and seeing how the vision of a stakeholder can be brought to life.

Olivia Brabers

Developer

Specializing in conducting in-depth research and user testing of the designs, ensuring our designs deliver strong results for stakeholders while creating an excellent experience for end users.

Yvonne van Schie

Developer

Working on challenging projects where I can bring creativity and new ideas to the table is my passion. Bridging the gap between design and development is where I find myself most comfortable.

Chris Sturm

Developer

Brings to the team the ability to conduct research and development of the AI as well as the necessary backend and frontend while making sure that the results fit the specification and requirements of the stakeholders.

Yannick Maas

Developer

I'm passionate about creating ideas and doing research in that segment. Having these research findings in my design choices that work drives me the most.

Felix Wijnberg

Agri Business

Experience in academic research and in client relations through business projects, I hope to contribute by tailoring this project to the clients' needs, and explore bridging the gap between AI and the agri-food sector.

PROJECT SCOPE

The project scope is to research, ideate, and experiment with different ways AI can be connected to physical objects in Eindhoven's public space.

In other words: the focus is on research and concept validation, with proof of concepts and a functional prototype as the end result.

DELIVERABLES

During our project a variety of work will be delivered. This ranges from concepting and ideation documents, to research, additional documentation, proof of concepts, and prototypes.

Besides the aforementioned products, a poster will be created for the AI & Data event, and a presentation will be held for the project at the end of the semester.

CONCEPT

Initial ideas and directions exploring how AI personalities can be embedded into public objects. Includes sketches, mood boards, and scenarios.

RESEARCH REPORT

Overview of datasets, technical possibilities, interaction forms, ethical considerations, and validation of concept research.

DOCUMENTATION

Stakeholder logbook, project logbook, technical documentation (architecture, APIs, system design), and user testing documentation.

PROTOTYPES

Physical interactive device and/or potential web product demonstrating the concept.

POSTER FOR AI EVENT

Clear visualization of the concept direction and potential research insights.

FINAL PRESENTATION

Showcasing research findings, design journey, and prototype results.

REQUIREMENTS

The project requirements are divided into functional and non-functional aspects that guide development, ensuring usability and scalability.

FUNCTIONAL

- The object should initiate an interaction with the user triggered by either sitting on it, using a trigger phrase, pressing a button, or interacting with a device.
- AI should be trained with topics to start or maintain a conversation (including historical facts/information linked to the statue/location of the object).
- Communication between objects (if multiple are set up later) should be possible.

NON-FUNCTIONAL

- The usability of the developed product should be intuitive.
- The system should allow for further expansion to multiple benches & statues.

RISK MANAGEMENT

To make sure that the whole project goes as smoothly as possible we conducted a possible risk assessment. To flag and identify potential risks as early on as possible.

PROTOTYPE DESTRUCTION

Prevention

Warning labels stating that the object is secured and traceable.

Mitigation

Insurance coverage for theft and damage.

UNINTENDED AI USAGE

Prevention

Implement content filters and ethical guidelines.

Mitigation

Provide a user reporting channel for inappropriate behavior.

PRIVACY RISKS

Prevention

Comply with GDPR and other privacy regulations.

Mitigation

Offer data deletion options.

WEATHER EXTREMES

Prevention

Design hardware with operational temperature ranges suitable for local climate.

Mitigation

Regular maintenance checks after seasonal changes.

NOISE DISTURBANCE

Prevention

Use directional speakers to reduce sound spread.

Mitigation

Schedule quiet hours at night

ENVIRONMENTAL IMPACT

Prevention

Optimize for low energy consumption

Mitigation

Set up recycling programs for end-of-life devices.

TIMELINE

To provide some information on our estimated planning, we've decided to divide the project into four sprints. Each sprint has their own focus area. Below you can find the rough estimation of time planning we've decided upon, and the allocated tasks per sprint.

1

SPRINT 1

Concepting, project proposal, researching

29/09/25 → 26/10/25

2

SPRINT 2

Experimenting with proof of concepts

27/10/25 → 16/11/25

3

SPRINT 3

Development

17/11/25 → 07/12/25

4

SPRINT 4

Finalizations of development. Preparing the final presentation/demo and handover documents.

08/12/25 → 11/01/26

THANK YOU

PROJECT PROPOSAL 2025

Thank you for reviewing our proposal. We look forward to shaping the future of Eindhoven together by exploring how AI can give a meaningful voice to public spaces and providing a new sense of wonder to the many people visiting and living in the city. Your support and feedback are vital in helping us transform these ideas into impactful, real-world experiences.
