

EINDHOVEN AI

MOOD OF THE DAY

Mood Of The Day is an interactive phone application which depicts the emotional energy of the surroundings in color.

Using sensors and AI, it interprets environmental data (movement, weather, light, sound) and expresses its "mood" by dynamic color changes, creating public spaces living representations of the mood of the city.

HOW DOES IT WORK?

- Inputs: sensors (motion, light, sound) + weather API
- AI Engine reads environmental conditions THAT determines color state
- Screen/LED color changes + possible ambient tone or voice confirmation

"Mood Of The Day turns the city's emotions into color, helping us see, feel, and reflect on the connection between our environment and our well-being."
