

GNOME HUNT

CONTEXT

An interactive AI & AR concept where visitors explore Eindhoven by collecting digital gnomes each representing the personality and story of a different district within Eindhoven.

- Each gnome speaks with a unique voice and personality: (creative → Strijp, cozy → Gestel).
- Users find them through QR codes which will load in an AR gnome.
- The gnomes tell local stories, share facts, recommend places to visit and let players "collect" them all.

TECHNOLOGY OVERVIEW

The AI Gnome Hunt app combines Artificial Intelligence with Augmented Reality (AR) and location-based services to create an interactive exploration experience across Eindhoven.

- AI identifies and personalizes gnome encounters based on regional culture, time of day, and (potentially) player behavior.
- AR overlays digital gnomes onto real-world landmarks using the phone's camera.
- GPS and map APIs track player location and guide them to new regions.
- Cloud storage manages collected gnomes and leaderboard data.
